

ADDRESS MISCONCEPTIONS:

A lot of fear around AI stems from science fiction and sensationalist media. It's important to differentiate between real AI and the AI portrayed in movies.

REASSURE ABOUT JOBS:

One of the biggest fears around AI is that it will lead to job losses. While it's true that AI may automate some jobs, it will also create new ones. Moreover, many jobs will benefit from AI, not be replaced by it.

REGULATIONS AND ETHICS:

Informing people about existing regulations on AI use can reassure them that there are checks and balances in place. Additionally, discussing ethical guidelines and principles followed by AI developers can also help alleviate fears.

PROMOTE AI LITERACY:

Schools and educational institutions can introduce AI as part of their curriculum so that students get introduced to AI from an early age and develop a sound understanding of it.
